

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A video processing method comprising:
receiving plural pieces of digital data ~~such as including at least one of~~ video and audio data, and an instruction signal indicating whether the plural pieces of digital data are to be multiplexed or ~~are to be demultiplexed and recorded~~~~not~~;
multiplexing the plural pieces of digital data, ~~when the instruction signal indicates the digital data to be multiplexed~~; and outputting the multiplexed digital data, and a flag indicating whether ~~or not~~ the digital data are multiplexed, ~~or not, when the instruction signal indicates that the digital data are to be multiplexed~~; and
~~adding information for synchronization to the plural pieces of digital data without multiplexing the digital data, and outputting the digital data having the information for synchronization added thereto, when the instruction signal indicates that the digital data are to be demultiplexed and outputted.~~
2. (Currently amended) A video processing method comprising:
receiving plural pieces of digital data ~~such as including at least one of~~ video and audio data, and scene description data indicating the ~~respective~~ playback times ~~or playback positions~~ of the ~~respective~~ digital data;
setting a scene description flag indicating whether ~~or not~~ there is a scene description ~~or not~~; and
outputting the digital data and the scene description flag.
3. (Currently Amended) The video processing method of Claim 1, further comprising:
generating access information for making an access to the digital data at an arbitrary time or at an arbitrary position; and
outputting the ~~accessed~~ digital data ~~accessed~~ and the access information.
4. (Currently Amended) The video processing method of Claim 2, further comprising:

generating access information for making an access to the inputted digital data at an arbitrary time or at an arbitrary position; and
outputting the accessed digital data accessed and the access information.

5. (Currently amended) A video processing apparatus comprising:
audio coding means for coding digital audio data;
video coding means for coding digital video data; and
multiplexing means for receiving plural pieces of coded digital data-~~eoded~~, and
an instruction signal indicating whether or not the plural pieces of digital data are to be
multiplexed or ~~not~~are to be demultiplexed and outputted, and multiplexing the plural
pieces of digital data when the instruction signal indicates that the digital data are to be
multiplexed, and outputting the multiplexed digital data and a flag indicating whether or
not the digital data are multiplexed-~~or not~~; and
outputting means for adding information for synchronization to the plural pieces
of digital data without multiplexing the digital data, and outputting the digital data having
the information for synchronization added thereto, when the instruction signal indicates
that the digital data are to be demultiplexed and outputted.

6. (Currently amended) A video processing method comprising:
receiving plural pieces of digital data such asincluding at least one of video and
audio data, anda multiplexing flag indicating whether or not the plural pieces of digital
data are multiplexed, or notand a scene description flag indicating whether or not there is
scene description data that indicate the respective playback times or playback positions of
the digital data;
outputting the digital data and the scene description data when the scene
description flag indicates that there is scene description data; and
demultiplexing the plural pieces of digital data, when the flag indicates that the
digital data are multiplexed; and outputting the demultiplexed digital data respectively,
when the multiplexing flag indicates that the digital data are multiplexed.

7. (Currently amended) A video processing method comprising:
| receiving plural pieces of digital data ~~such as~~ including at least one of video and
| audio data, and a scene description flag indicating whether there is scene description data
| that indicate the respective playback times ~~or playback positions~~ of the respective digital
| data; and
| outputting the digital data and the scene description data when the scene
| description flag indicates that there is scene description data.
8. (Currently amended) A video processing apparatus comprising:
| audio decoding means for decoding digitized audio data;
| video decoding means for decoding digitized video data; and
| demultiplexing/control means for
| | detecting a multiplexing flag indicating whether or not the plural pieces of
| | digital data are multiplexed, ~~or not, and when the multiplexing flag indicates that~~
| | the digital data are multiplexed, demultiplexing the plural pieces of digital data
| | ~~when the flag indicates that the digital data are multiplexed~~, and controlling the
| | said audio decoding means and the said video decoding means so as to output the
| | plural pieces of digital data separately, and
| | detecting a scene description flag indicating whether there is scene
| | description data that indicate the respective playback times or playback positions
| | of the digital data, and when the scene description flag indicates that there is
| | scene description data, controlling said audio decoding means and said video
| | decoding means so as to output the digital data and the scene description data.
9. (Currently amended) A video processing apparatus comprising:
| audio coding means for coding digital audio data;
| video coding means for coding digital video data; and
| multiplexing data recording means for
| | receiving the plural pieces of coded digital data ~~coded~~, and an instruction
| | signal indicating whether the plural pieces of digital data are to be multiplexed or
| | ~~not~~ are to be demultiplexed and recorded, and

multiplexing the plural pieces of digital data ~~when the instruction signal indicates the digital data to be multiplexed, and outputting recording the multiplexed digital data and a flag indicating whether that the digital data are multiplexed onto the same recording medium, when the instruction signal indicates that the digital data are to be multiplexed, and or not; and data recording means for recording the multiplexed digital data and the flag indicating whether the digital data are multiplexed or not, onto the same recording medium.~~

adding information for synchronization to the plural pieces of digital data without multiplexing the digital data, and recording the digital data having the information for synchronization added thereto, when the instruction signal indicates that the digital data are to be demultiplexed and outputted.

10. (Currently amended) A data computer-readable recording medium ~~containing having~~ a video processing program stored thereon for making a computer execute a process of recording plural pieces of digital data ~~such as~~including at least one of video and audio data onto the same recording medium, ~~the said~~ video processing program comprising:

a first program segment for receiving plural pieces of digital data such as video and audio dataincluding at least one of video and audio data, and an instruction signal indicating whether the plural pieces of digital data are to be multiplexed or ~~not~~are to be demultiplexed and recorded;

a second program segment for multiplexing the plural pieces of digital data when the instruction signal indicates that the digital data are to be multiplexed;

a third program segment for outputting the multiplexed digital data, and a flag indicating whether or not the digital data are multiplexed or not when the instruction signal indicates that the digital data are to be multiplexed; and

a fourth program segment for recording the outputted multiplexed digital data and the flag indicating whether or not the digital data are multiplexed ~~or not~~, onto the same recording medium when the instruction signal indicates that the digital data are to be multiplexed.; and

a fifth program segment for adding information for synchronization to the plural pieces of digital data without multiplexing the digital data, and outputting the digital data having the information for synchronization added thereto, when the instruction signal indicates that the digital data are to be demultiplexed and outputted.

11. (Currently amended) A data computer-readable recording medium containing having a video processing program stored thereon for making a computer execute a process of recording plural pieces of digital data such as including at least one of video and audio data onto the same recording medium, the said video processing program comprising:

a first program segment for reading plural pieces of digital data such as including at least one of video and audio data, and a multiplexing flag indicating whether or not the plural pieces of digital data are multiplexed or not;

a second program segment for judging whether or not the plural pieces of digital data are multiplexed or not, based on the basis of the multiplexing flag; and

a third program segment for demultiplexing the plural pieces of digital data when it is judged said second program segment judges that the plural pieces of digital data are multiplexed, and outputting the respective obtained digital data obtained separately.;

a fourth program segment for receiving plural pieces of digital data including at least one of video and audio data, and a scene description flag indicating whether there is scene description data that indicate the respective playback times or playback positions of the digital data;

a fifth program segment for judging whether there is the scene description data based on the scene description flag; and

a sixth program segment for outputting the digital data and the scene description data when said fifth program segment judges that there is scene description data.

12. (Currently amended) A data computer-readable recording medium containing operable to be accessed by a computer and having stored thereon plural pieces of digital data such as including at least one of video and audio data, and multiplexing flags corresponding to the respective digital data and indicating whether or not the respective

digital data are multiplexed or not, and a scene description flag indicating whether there is scene description data that indicate the respective playback times or playback position of the digital data.

13. (Cancelled)
